

Sensor board for Light Following is also the same above just remove the 120 ohms resistors and LEDs since you will provide your own light source.

Code

```
1  <em>void main() {
2      portb = 0x00;
3      trisa = 0x0f;
4      trisb = 0x00;
5      while(1){
6          if (porta.f0 == 0){
7              if (porta.f1 == 0){ //00
8                  if (porta.f2 == 0){
9                      if (porta.f3 == 0){ //0000
10                         portb = 0x00;
11                     }
12                     else if (porta.f3 == 1){ //0001
13                         portb = 0x60; //move left
14                     }
15                 }
16                 else if (porta.f2 == 1){
17                     if (porta.f3 == 0){ //0010
18                         portb = 0x90; //move right
19                     }
20                     else if (porta.f3 == 1){ //0011
21                         portb = 0x50; //move forward
22                     }
23                 }
24             }
25             else if (porta.f1 == 1){ //01
26                 portb = 0x50; //move forward
27             }
28         }</em>
```

```
29
30  else if (porta.f0 == 1){
31      if (porta.f1 == 0){ //10
32          portb = 0xa0; //move backward
33      }
34      else if (porta.f1 == 1){ //11
35          if (porta.f2 == 0){
36              if (porta.f3 == 0){ //1100
37                  portb = 0x00;
38              }
39              else if (porta.f3 == 1){ //1101
40                  portb = 0x60; //move left
41              }
42          }
43          else if (porta.f2 == 1){
44              if (porta.f3 == 0){ //1110
45                  portb = 0x90; //move right
46              }
47          }
48          else if (porta.f3 == 1){ //1111
49              portb = 0x00; //move forward
50          }
51      }
52  }
53  }
54  }
55  }
```
